diagrams 1 and 2 illustrate these aspects. the plots of these evaluations for example data sets 1 (empty squares) and 2 (filled squares) are shown in figures 7 and 8. we can see that the observed vs. expected value for these data sets are in excellent agreement. it is important to observe that the variance of the estimated area, eq ( 29 ), increases as the estimated area, eq ( 19 ), decreases. a key question is how many points are required to estimate the area within a given accuracy. this question is answered by the number of image points required to estimate the area at a given accuracy. as we have previously pointed out, we can estimate the area up to 0.05mm<sup>2</sup> at a distance of 10, 18 and 28 mm from the center of the target. if a 10 mm square is assumed, then the area can be estimated to within +/- 1% at a distance of less than 100 pixels from the center of the target. in the summer of 2017, while working for the department of the navy at los angeles, charles' was at the office of mr. mather, just as they had done since they had met. charles had known at once that the reason for mather's presence in the office was to recover the five million in funds from the enron corporation. charles was not ready to tell this to mather, and so he opened a new file on his computer and sent a mail to his friend. "hey, charles, mather wants to bring over the \$5 million he embezzled from enron. he can't seem to find it. if you've got any ideas, send them to me." charles named the file after mather (chester) and clicked "send" on his computer and sent the file to his friend. later that night, charles received the file with a file attachment (chester.dpg) in his gmail mailbox and he opened it. the file was a preliminary proof that the highly creative idea charles had thought of would work. charles' idea was as follows: the first thing that charles saw in the file was a map of the united states. next to it were the names of the states and the names of the cities in those states. charles saw that the street names made up a perfect streets map in los angeles. in order to detect the name of the companies in each of the states, charles used a map of los angeles, the exact streets map of los angeles, and the corporations names he'd found on the map. charles also knew the headquarters of the corporations, and that they were located in distinct geographical locations. this map was the basis for the coding concept. charles knew that it would be impossible to write down all the names of the corporations that mather was using. for that reason, charles also looked for smaller corporations, (less than one million) and the names of those companies made up a sample from all the u.s. companies. charles also discovered that the names of the smaller firms always began with the letter a. from this, he began to write the first code words from the 300 words that were contained in the document. in fact, he worked through the first 200 words, which included those from the names of the states and the surnames of the states, along with the names of the main cities and their residences and the names of the local names, not the suburbs. at this point in the process, charles realized that he had to choose the surnames and the names of the states and the cities very carefully, not trusting the words that were already written in the file. they would have to be placed into four categories: prime words, common words, words that were impossible, and those that were obviously made up. next, charles looked for the words that identified the companies that were using the money that mather had embezzled. they would be the "names" of the companies, and he had to know that mather had. charles used all the names of the large companies, names of smaller companies, and the names of the cities in which the companies were located. with this data, he began to look for the 10 percent that were the names of the cities, and looked for the remaining 90 percent of the names of the corporations in which they would begin with the letters a. after a long and painstaking, yet ingenious, task, charles found the names that had to be eliminated. on the second page, charles found the names of the states and the surnames of the states, and looked at the names of the cities and the municipalities.
