windows xp sp2 and above: this vulnerability affects windows xp-based client computers that are configured to use ntlm authentication. the microsoft network policy troubleshooter (mntpsvc) service that is the destination for netlogon connections does not properly terminate the connection when the users log off. the connection allows the user who is logging off to read from the c: drive and also access the user profile information. the service uses a global identifier that is a hash value for the lm-policy group policy object. if the hash value is set to a value of 0xffffffff00000000, it allows any user who is logged on to read from the c: drive. windows xp sp2 and above: this issue can be resolved by enabling the ipsec and ntlm authentication interoperability extensions for windows xp (ip-ntlmv2) using group policy. the windows xp-based client computers that are affected by this issue must also be configured to use ntlmv2 authentication. in windows xp sp3 and above: if you install the ipsec and ntlmv2 authentication interoperability extension for windows xp, the client computers that are affected by this issue are automatically configured to use ntlmv2 authentication. the msvc service can be disabled by setting the hash value to 0x00000000ffffffff. the service can also be removed completely by removing the msvc service. windows xp sp2 and above: there is a new group policy setting to disable the msvc service. this service is installed by windows xp-based clients that have ntlmv2 authentication enabled. if you do not want to have a service that is required for ntlmv2 authentication on the client computer, you can disable it. on a windows xp sp2 client, to turn off the service, use the group policy editor to edit the group policy object named computer configuration\policies\administrative templates\windows components\policies\messages and alerts\security\msvc and set the value of the disabled policy to enabled. to turn off the service on windows xp sp3 or later, you can use the group policy editor to edit the group policy object named computer configuration\policies\windows settings\security settings\local policies\security options network security: network servers: ntlm authentication: disable msvc and set the value of the disabled policy to enabled.

windows server 2003: the default behavior of the address book service is to open a list of user profiles when a user logs on. this behavior results in a slower access time to the address book and can be changed through group policy. if you want to make the address book data available to other users on the network, you can change the default-profile property for the address book service. this setting has the same effect as the set-addefaultprofile command on the appropriate policy object. the following table lists the settings that are available.

property name	description	category	value	default-profile
indicates whether profiles are shown	addressbook service	\$true, \$false	windows xp:	
if you enabled the windows security center feature on windows xp, the data execution prevention (dep) option cannot be disabled unless you are an administrator. when you click the advanced button for this feature and disable dep, the option remains disabled on the data execution protection dialog box.				
windows vista and windows server 2008: when you configure a security warning to appear when trying to connect to an smb server, you can prevent windows from connecting to the smb server. to do this, open group policy management and configure the following property.				
default-network-credential-use-domain-based-policy	note: group policy might not be installed by default. in this case, right-click the start menu, point to programs, click accessories, and double-click command prompt. type gpedit.msc, and press enter.
